TECH, EXPLAINED

Why we store money in paise

₹1,499.50 is stored as 149950. Here is why.

INSIDE

1. Whole numbers only
2. Decimals drift
3. Splits that don’t add up
4. The leftover paisa gets a home
5. Rupees only at the end

Vishan Amarnath · Co-founder & CTO, Bizzzauto

₹

Whole numbers only

Every amount becomes a whole number of paise. No decimals anywhere in the maths.

STORED AS

₹1,499.50 → 149950

Decimals drift

Computers are surprisingly bad at decimals. Tiny errors add up in a ledger.

TRY IT IN MOST LANGUAGES

0.1 + 0.2 = 0.30000000000000004

Splits that don't add up

₹1,000 in three milestones is ₹333.33 three times.

WHERE DID THE PAISA GO?

333.33 × 3 = 999.99

The leftover paisa gets a home

Split once, and give the leftover paisa to one fixed instalment.

ALWAYS ADDS BACK UP

33,334 + 33,333 + 33,333 = 1,00,000

Rupees only at the end

Decimals appear only on the screen and the PDF. The invoice, ledger and dashboard agree.

THE RULE

One paisa doesn't matter. Matching numbers do.

1. Store whole paise
2. Do the maths on whole numbers
3. Give the leftover paisa a home
4. Show rupees only at the end

Do your invoice and your dashboard always agree?
