TECH, EXPLAINED

How a system knows you really paid

Not from the “payment successful” page.

INSIDE

1 The success page proves nothing

2 A webhook

3 Check the signature

4 Count it once

5 Then unlock the next step

The success page proves nothing

Tabs close, networks drop, and a web address can be opened by anyone.

A webhook

The payment company calls our server directly: “this payment went through”. No browser in between.

Check the signature

Proof that the message really came from the payment company.

Count it once

Webhooks can arrive twice. A payment must only count once.

Vishan Amarnath · Co-founder & CTO, Bizzzauto

Then unlock the next step

The booking confirms, the order moves, the receipt goes out.

THE RULE

Trust the message you can verify, not the screen.

1. Ignore the success page
2. Wait for the webhook
3. Check the signature
4. Count it once
5. Then move the work on

How does your system confirm a payment?
