TECH, EXPLAINED

How a 300 MB video survives a bad network

Uploads built for mobile data, basements and patchy signal.

INSIDE

1 Split it into chunks

2 One piece at a time

3 Confirm every piece

4 Resume, don’t restart

5 Put it back together

Split it into chunks

The video is cut into small pieces before anything is sent.

One piece at a time

Each chunk is small enough to finish, even on a weak signal.

Confirm every piece

The server says “got it” for every chunk, so the upload knows how far it got.

Resume, don’t restart

If the network drops, it picks up from the last confirmed chunk.

Put it back together

The server joins the chunks into the original file and processes the video.

FOR BIG PHOTO FILES

- A short-lived link sends them straight to storage

THE RULE

Big files on bad networks are normal.

1. Split into chunks
2. Send one at a time
3. Confirm each piece
4. Resume from the last one
5. Rebuild on the server

Where do uploads fail most in your business?
