OFFERS & FUNNELS

How we price a custom build

Three numbers per module, one formula, no guessing.

INSIDE

1 Break it into modules

2 Rate the complexity

3 Three estimates per module

4 Add the work around the code

5 Adjust for scope clarity

Sukeshwar R K · Co-founder, Bizzzauto

Break it into modules

Bookings, payments, staff, reports. Each one is estimated on its own.

Rate the complexity

Low, medium or high. Each level starts from a set number of hours.

Three estimates per module

The best case, the most likely case and the worst case.

THE FORMULA

(Best + 4 × Likely + Worst) ÷ 6

Add the work around the code

Project management, testing and deployment are real hours too.

Adjust for scope clarity

A vague scope carries more risk, so it costs more. A clear one costs less.

THE METHOD

A quote is a set of decisions you can explain.

1. Modules, not a lump sum
2. Complexity sets the baseline
3. Three estimates, one formula
4. Management, testing, deployment
5. Adjusted for scope clarity

How do you price work that's different every time?
